Columns and Their Descriptions

ID: Unique match identifier.
City: City where the match was played (may contain missing values).
Date: Date of the match.
Season: IPL season year (e.g., 2008, 2022).
MatchNumber: Match number in the respective season.
Team1: Name of the first team in the match.
Team2: Name of the second team in the match.
Venue: Stadium or ground where the match was held.
TossWinner: Team that won the toss.
TossDecision: Toss decision taken (bat or bowl).
SuperOver: Indicates if a Super Over was played (Yes/No).
WinningTeam: Team that won the match.
WonBy: Indicates if the match was won by runs or wickets.
Margin: Margin of victory (runs or wickets).
method: Method used to determine results in interrupted matches (e.g., Duckworth-Lewis, rarely present).
Player_of_Match: Player who was awarded "Player of the Match".
Team1Players: List of players in Team 1.
Team2Players: List of players in Team 2.
Umpire1: Name of the first on-field umpire.
Umpire2: Name of the second on-field umpire**.**

Task 1: Standardization of Team Names (Franchise Renaming)

In the given dataset, some IPL teams are listed using their old franchise names. You are required to standardize the team names by replacing them with their updated official names.

Old Name → New Name Mapping:

- Delhi Daredevils → Delhi Capitals
- Kings XI Punjab → Punjab Kings
- Rising Pune Supergiants → Rising Pune Supergiant

Task 2: Identify the Top Winning Team per Season

For every season:

- Identify the team with the **highest number of wins**
- Display:
  - Season
  - Winning Team (with maximum wins)
  - Number of Wins
- Output format (DataFrame columns):

  Season | WinningTeam | number_of_wins

Task 3: Player of the Match Diversity per Winning Team

For each winning team:

- Calculate the number of **unique players** who received the *Player of the Match* award
- Display the diversity count for each team
- Arrange the results in **descending order of diversity**
- Output format (DataFrame columns):

WinningTeam | number_of_unique_player

Task 4: Display Teams by Match Wins Based on Toss Decision (Descending Order)

For each toss decision:

- Calculate the number of matches won by each team.
- Display the results in descending order of wins.
- Output format (DataFrame columns):

  TossDecision | WinningTeam | wins

Task 5: Analysis of Top Five Venues with Highest Match Frequency and Their Dominant Winning Teams (Descending Order)

- Identify the top 5 venues where the highest number of matches have been played
- For each of these venues:
  - Calculate which team has won the most matches at that venue
  - Display the dominant team along with the number of wins
- Sort the results in descending order of winning matches
- Output format (DataFrame columns):
  Venue | WinningTeam | no_of_winning_match

Task 6: All Season-wise IPL Points Table Generation

For each season output in data frame:

- Calculate the total number of matches played by each team
- Calculate the total number of matches won by each team
- Identify matches with no result
- Compute total points using:
  - Win = 2 points
  - No Result = 1 point
- sorting teams based on points in descending order

Output format (example):

Season: 2022

Team Name	Matches Played	Matches Won	No Result	Points
Gujarat Titans	16	12	0	24
